Final Cut Pro Walkthrough

1. Go to File>New Project
2. Select the Timeline and Go to Sequence>Settings
3. In the Settings window change
   - aspect ratio to custom
   - frame size to 720x405
   - editing time base to 24fps (default should be set to 29.97)
   - compressor to Sorenson Video 3

4. Click OK
5. Now go to Final Cut Pro>User Preferences
6. Go to the Editing tab and change Still/Freeze Duration from 00:00:10:00 to 00:00:00:01
7. Click OK
8. (Out of Final Cut Pro) Put all of your rendered images into a new folder
9. (In Final Cut Pro) Go to File>Import>Folder and find the new folder you made for your images and click Choose (the folder should now be in the Browser)
10. Drag the folder from the browser top the Timeline (make sure you position it at the beginning of the line)
11. Scrub through the Timeline and make sure that all of the images play properly
12. Select Sequence1 in the Browser
13. Go to File>Export>Using Quicktime Conversion
14. Name your file
15. Select the save destination
16. Now go to Format and click on the Options button
17. In this window double check your settings
18. If the settings are not correct click on the Settings button and set the codec to Sorenson Video 3 and put the quality to best.
19. Go back to the Options window and click on the Size button
20. Set it to custom then change the resolution to 720x405
21. Once that is all set up click OK
22. Finally In the Save window click Save
23. Final Cut Pro should initiate your render and make your movie

****Make sure you play your movie to double check that it works
